C; Comment: The beta chain contains an ATP binding site, a tyrosine autophosphorylation
Site for myristate on lysine.
C; Comment: Autophosphorylation increases Kinase activity and makes it more insulin-ind
C; Comment: Autophosphorylation increases Kinase activity and makes it more insulin-ind
C; Comment: Autophosphorylation increases Kinase activity and makes it more insulin-ind

DEMONDED FOR THE PARTY OF THE PROPERTY OF THE PARTY OF TH

tyrosine phosphate.
-- SUBDNIT: Heterodimer with each of the other ERBB receptors (Potential). Interacts with PRKCABP (By similarity).
-- SUBCELLULAR LOCATION: Type I membrane protein.
-- PIM: Ligand-binding increases phosphorylation on tyrosine

residues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 73
                                                                                                                                                                            "The epidernal growth factor receptor engages receptor interacting protein and nuclear factor-kappa B (NF-kappa B)-inducing kinase to activate NF-kappa B. Identification of a novel receptor-tyrosine kinase signalosome.";

J. Biol. Chem. 276:8865-8874(2001).

-: FONCTION: Receptor for BGF, but also for other members of the BGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding BGF-like growth factor, GP30 and vaccinia virus growth factor. Is involved in the control of cell growth and differentiation.

-:- FUNCTION: Isoform 2/truncated isoform may act as an antagonist.

-:- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        69 ASLSFLQDIQEVQCYVLIAHNQVRQVPLQRLRIVRGTQLFEDNYALAVLDNGDPLNNTTP

Estinger D.P., Serrero G.;
Submitted (UTM.1992) to the EMBL/GenBank/DDBJ databases.

1. Submitted (UTM.1992) to the EMBL/GenBank/DDBJ databases.

1. PUNCTION: THE EGF PECEPTOR MEDIATES THE BIOLOGICAL SIGNAL OF EGF.

AND ALSO OF TGF-ALPHA, AMPHIREGULIN, HEPARIN-BINDING EGF, GP30 AND

VACCINIA VIRUS GROWTH FACTOR (BY SIMILARITY).

1. CATALYTIC ACTIVITY: ATP + a protein tyrosine a ADP + protein

1. CATALYTIC ACTIVITY: The + a protein tyrosine phosphate.

1. SUBGLILUIAR LOCATION: Type I membrane protein.

2. Induction of the tyrosine kinase activity, stimulation of cell DNA synthesis, and cell proliferation.

3. SIMILARITY: Belongs to the EGF receptor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. "Expression of neuregulins and their putative receptors, ErbB2 and ErbB3, is induced during Wallerian degeneration.";

J. Neurosci. 17:1642-1659 (1937).

-: FUNCTION: Specifically binds and is activated by neuregulins, NRG-2, NRG-3, hepgarin-binding EGF-like growth factor, betacellulin and NTAK. Interaction with these factors induces cell differenciation. Not activated by EGF, TGF-A, and amphiregulin (By similarity).

CYS
                           tyrosine phosphate.
-!- SUBMUTT: Homodimer or heterodimer with each of the other ERBB receptors. Interacts with the PDZ domain of the syntrophin SNTB2 (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Preferentially expressed in the developing nervous system. Exhibits distinct and highly regionalized patterns of expression in the adult brain, where it is mainly found in the reticular nucleus of the thallamus. Very low levels in kidney, and
CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                    increases phosphorylation on tyrosine
                                                                                                                                                                                                                                                                                                                                                                                        -!- PTM: Ligand-binding increases phosphorylation on residues (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               heart.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DISULFID

Proc. Natl. Acad. Sci. 1. S.A. 97.3596-3601(2000).

Proc. Natl. Acad. Sci. 1. S.A. 97.3596-3601 (2000).

2. NRG-3, heparin-binding BGF-like growth factor, betacellulin and NTAK. Interaction with these factors induces cell differenciation.

Not activated by EGF. TGF-A, and amphiregulin.

Not activated ACTIVITY: ATP + a protein tyrosine = ADP + protein
Foy L., Neubauer M.G., Shoyab M.; "Ligand-specific activation of HBR4/pl80erbB4, a fourth member of the epidermal growth factor receptor family."; Proc. Natl. Acad. Sci. U.S.A. 90:1746-1750(1993).

-: TISSUS SPECIFICITY: Epithelial_tissues and brain.
-: DAGAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SHI OF ALL DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.
-: PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMYCES ITS ASSOCIATION WITH THE PBS SUBUNIT OF PHOSPHATIDYLINGSTOL 3. KINASE (BY SIMILARITY).
-: DISBASE: Overexpressed in a subset of human mammary tumors.
-: SIMILARITY: Belongs to the EGF receptor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                POTENTIAL.
RECEPTOR PROTEIN-TYROSINE KINASE BRBB-3.

ISOId=P04412-2; Sequence=VSP 002897;
TISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED IN EMBRYOS. IN LARVAE,
UNIFORM EXPRESSION IS SEEM IN WING DISKS, GENITAL DISK, ANIAGEN OF
TESTIS AND OVARY, AND BRAIN CORTEX. IN EYE-ANTENNA DISK, HIGHEST
EXPRESSION IS ANTERIOR TO MORPHOGENETIC FURROW, LEVELS REMAIN HIGH
IN PHOTORECEPTOR PRECURSOR CELLS. THIS PATTERN IS REVERSED IN
POSTERIOR EYE DISK. IN ADULTS EXPRESSION IS HIGH IN BRAIN CORTEX
AND THORACIC AND ABDOMINAL GANGLIA.
SIMILARITY: Belongs to the EGF receptor family.

  MOI. Biol. Cell 10:2087-2100(1999).

-! FUNCTION: Tyxosine kinase receptor required for the induction of vulval differentiation. Possible receptor for the inductive signal required for vulval development. Activated by lin-3 and acts by way of let-60 RAS. The lin-3/let-23 pair is a simplified version of the mammalian neuregulin-ERBB network.

-! CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine ADP + protein tyrosine ADP + protein cyrosine ADP + protein cyros

Submitted (APR-1991) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS RECEPTOR PROBABLY BINDS AN INSULIN RELATED PROTEIN
AND HAS A TYROSINE-PROTEIN KINASE ACTIVITY (BY SIMILARITY).
-!- CATALYITIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein (By similarity).
-!- TISSUE SPERSEYERITY: EXPRESSED IN DIVIDING EPITHELIAL CRILS.
-!- RINLARITY: Belongs to the Tyr family of protein kinases. Insulin receptor subfamily.
  Glycoprotein, Arp-binding, Phosphorylation; Signal.

tyrosine phosphate.
-:- SUBUNIT: TETRAMER OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOWAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOWAIN.
-:- SUBCELLULAR LOCATION: Type I membrane protein.
-:- SIMILARITY: Belongs to the Tyr family of protein Kinases. Insulin receptor subfamily.

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation. The European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). PERFORMED STATES AND S LYTOSINE DEOSPHATE.

- SUBUNT: TETRAMER OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOMAIN.

- SUBCELLULAR LOCATION: Type I membrane protein.

- SUBLIGATION: Selongs to the Tyr family of protein kinases. Insulin receptor subfamily.

- SIMILARITY: Contains 2 fibronectin type III domains. SEQUENCE OF 1134-1203 FROM N.A.

\*\*REDLINE=90152381; PubMed=2482828,

\*\*WILKS A.F., Kurban R.R., PubMed=2482828,

\*\*WILKS A.F., Kurban R.R., PubMed=2482828,

\*\*The application of the polymerase chain reaction to cloning members of the protein tyrosine kinase family.\*;

Gene 85:67-74 (1989).

-!- FUNCTION: THIS RECEPTOR BINDS INSTLIN-LIKE GROWTH FACTOR I (IGF I)

\*\*WITH A HIGH APPINITY AND IGF II WITH A LOWER APPINITY. IT HAS A

TYROSINE-PROTEIN KINASE ACTIVITY.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein INSULIN-LIKE GROWTH FACTOR I RECEPTOR, CYTOPLASMIC (BY SIMILARITY). FIBRONECTIN TYPE-III 1. FIBRONECTIN TYPE-III 2. EXTRACELLULAR (POTENTIAL). PROTEIN KINASE.
ATP (BY SIMILARITY).

RA "Byolution of the probormone convertases: identification of a monologue of PCG in the protochordate amphioxus.";

RL Biochim. Biophys. Acta 1477:389-348(2000).

-!- FUNCTION: Likely to represent a widespread endoprotease activity of cleavage at the RX[K/R]R consensus motif (By similarity).

-!- CATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Xaa-Yaa-Arg-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.

-!- SUBCELLULAR LOCATION: ISOFORM A AND ISOFORM C ARE SECRETED.

IsoId=Q9NJ15-1; Sequence=Displayed;

Name=A; IsoId=09NJ15-2; Sequence=VSP\_005444, VSP\_005445;

Isold=09NJ15-3; Sequence=VSP 005442, VSP 005443; DOMAIN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic reticulum

-!- SIMILARITY: Belongs to peptidase family S8. -!- SIMILARITY: Contains 1 homo B/P domain.

Murine subtilish-like proteinase SPC6 is expressed during embryonic implantation, somitogenesis, and skeletal formation.";
Dev. Genet. 21:75-81(1997).
1- FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and regulated secretory pathway. Capable of cleavage at the RK RK consensus motif. May be responsible of cleavage at the RK RK consensus motif. May be responsible of or the maturation of gastrointestinal peptides. May be involved in the cellular proliferation of adrenal cortex via the activation of growth factors.

--- CATALYTIC ACTIVITY: Release of mature proteins from their proprecients by cleavage of Arg-Xaa-Yaa-RG--Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.

--- SUBCELLULAR LOCATION: PC5A IS SECRETED THROUGH THE REGULATED TO A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH EARLY ENDOSOMES.

sac followed by a confination to dermamyotome compartment. Between B9.5 and B11.5, abundant expression in ARR (thinkened ectodermal cells of limb buds). At E12.5, expression in the limbs is confined to the condensing mesenchym surrounding the cartilage. At this stage, strong expression also detected in vertebral and facial cartilage primordia and in the muscle of the tongue. At E16.5, abundant expression in epithelial cells of the intestinal vili.

1 soform A is most abundant at all stages but significant levels of isoform B occur at E12.5.

-!- DOWALN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic reticulum.

-!- DOWALN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.

-!- SIMILARITY: Belongs to peptidase family SB.
